2013 Air Quality Progress Report

for

North West Leicestershire District Council

In fulfilment of

Part IV of the Environment Act 1995

Local Air Quality Management

Date: May 2013

Local Authority Officer	Gareth Rees
Department	Street Action Team Community Services
Address	North West Leicestershire District Council, Council Offices, Whitwick Road, Coalville, Leicestershire, LE67 3FJ
Telephone	01530 454545
e-mail	Environmental.protection@nwleicestershire.gov.uk
Report Reference number	NWLDC-PR-2013
Date	May 2013

Executive Summary

This progress report has been produced as part of North West Leicestershire District Council's requirement to assess present and predicted future air quality against the objectives prescribed by the Air Quality Regulations 2000 (as amended). If an exceedence of any objective is considered likely, there is a requirement to proceed to a Detailed Assessment of that pollutant and to declare an Air Quality Management Area (AQMA), if the exceedence is confirmed. The council has declared 5 Air Quality Management Areas since 2001. In order to assess the air quality in the district this report considers new monitoring data and assesses the impact of new developments on air quality within the district.

The council undertakes extensive monitoring of nitrogen dioxide (NO_2) using passive diffusion tubes and automatic monitors.

Exceedences of the annual mean air quality standard for NO_2 were detected within several of the AQMAs it is also assumed that the M1 Mole Hill AQMA exceeded the 1 hour mean objective for NO_2 as the annual mean exceeded 60 μgm^{-3}. No exceedence of the hourly mean air quality standard for NO_2 was detected in the Coalville AQMA.

The council needs to:

- Publish Coalville traffic assessment as recommended by the 2013 Further assessment of Coalville AQMA[23]
- Publish a revised air quality action plan

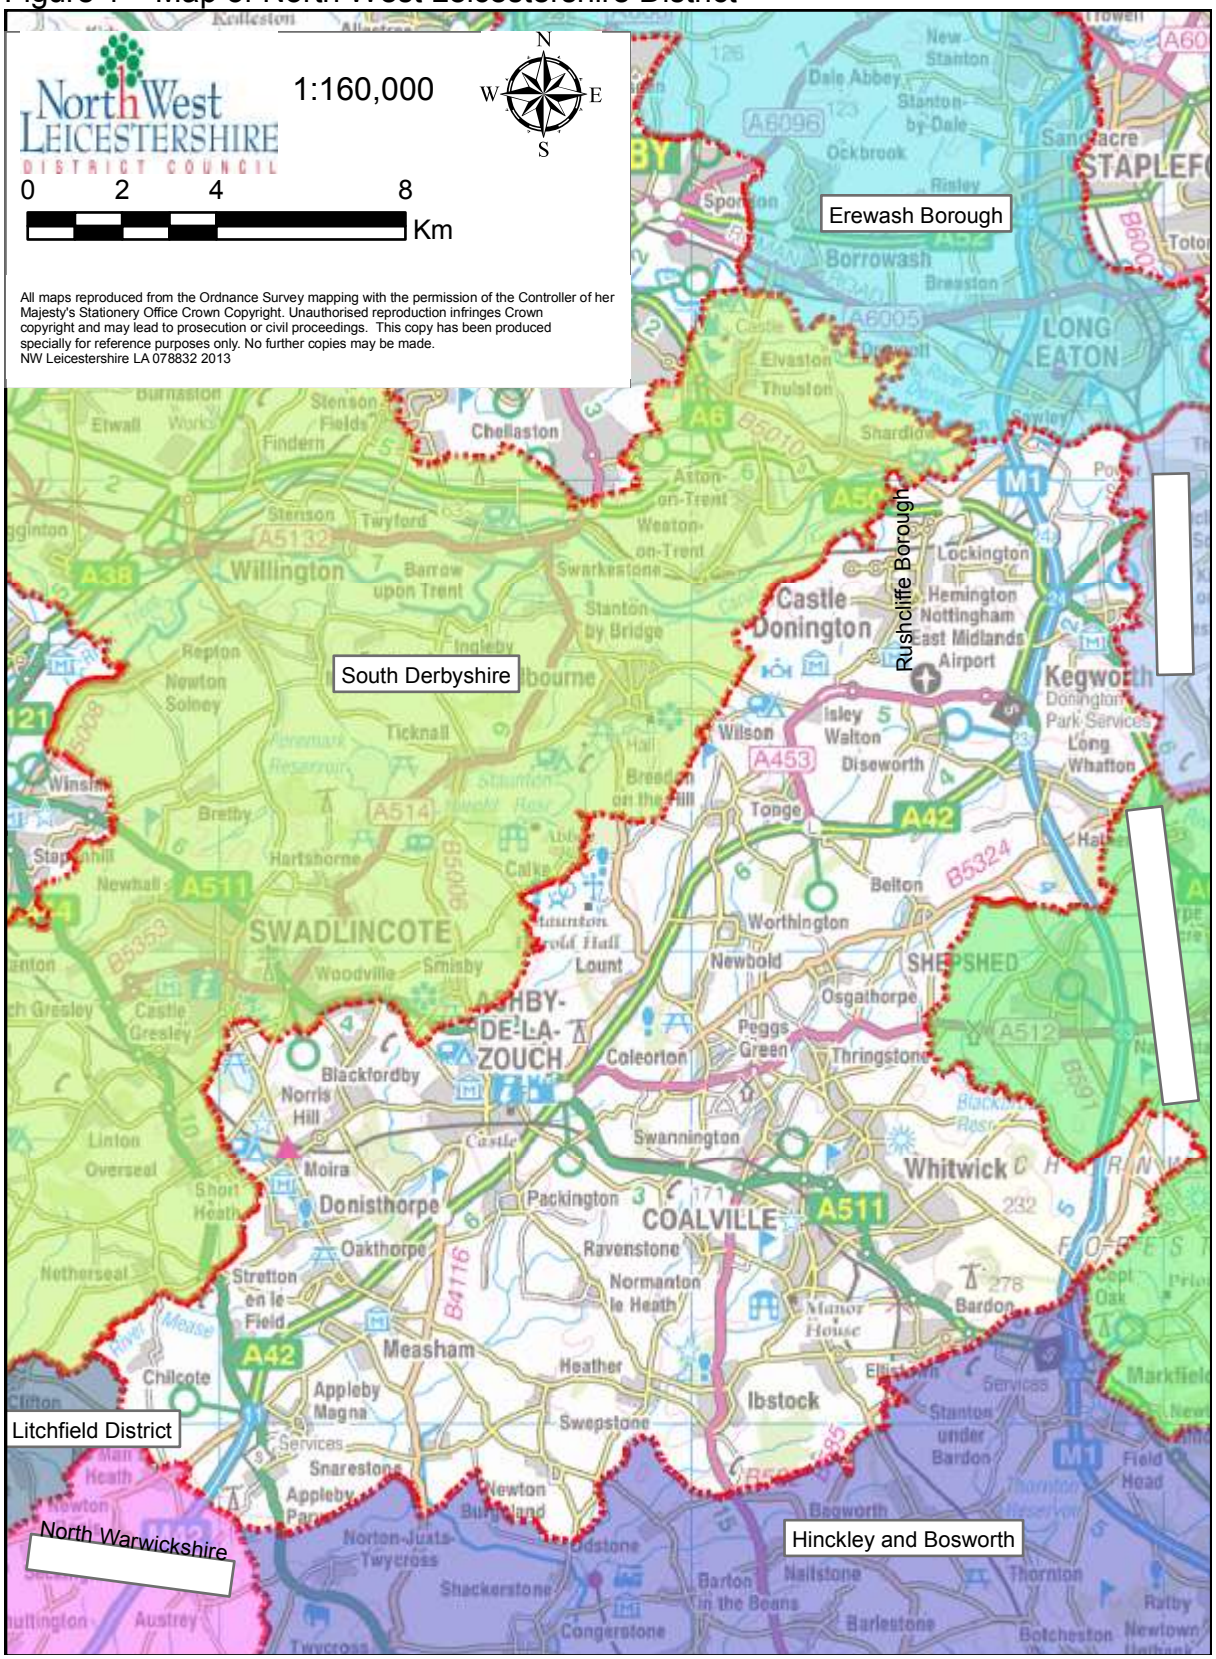
1 Introduction

1.1 Description of Local Authority Area

Figure 1 Map of North West Leicestershire District



North West Leicestershire lies in the East Midlands Region and is both the name and geographical location. The district is situated in the heart of the National Forest and lies between Leicester, Burton-on-Trent, Derby and Nottingham, covering approximately 280Km^2 (approximately 108 square miles). The district is mostly rural with a large extent of industry historically from coal mining, but more recently with Nottingham East Midlands Airport and large quarries.

The 2011 census found the population of the district to be 93,468[50]; the population is mainly distributed in the principle towns of Coalville and Ashby-de-la-Zouch; and the large villages of Castle Donington, Kegworth and Ibstock.

Three established main roads run through the district,

- the M42/A42 between Birmingham and Nottingham,
- the M1,
- and the A511 from Leicester to Burton-on-Trent.

1.2 Purpose of Purpose of Progress Report

This report fulfils the requirements of the Local Air Quality Management process as set out in Part IV of the Environment Act (1995), the Air Quality Strategy for England, Scotland, Wales and Northern Ireland 2007 and the relevant Policy and Technical Guidance documents. The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where exceedences are considered likely, the local authority must then declare an Air Quality Management Area (AQMA) and prepare an Air Quality Action Plan (AQAP) setting out the measures it intends to put in place in pursuit of the objectives.

Progress Reports are required in the intervening years between the three-yearly Updating and Screening Assessment reports. Their purpose is to maintain continuity in the Local Air Quality Management process.

They are not intended to be as detailed as Updating and Screening Assessment Reports, or to require as much effort. However, if the Progress Report identifies the risk of exceedence of an Air Quality Objective, the Local Authority (LA) should undertake a Detailed Assessment immediately, and not wait until the next round of Review and Assessment.

1.3 Air Quality Objectives

The air quality objectives applicable to Local Air Quality Management (LAQM) in England are set out in the

- The Air Quality (England) Regulations 2000 (SI 2000/0928)[25],
- The Air Quality (England) (Amendment) Regulations 2002 (SI 2002/3043)[26]
- The Air Quality Standards Regulations 2007 (SI 2007/0717)[27]
- The Air Quality Standards Regulations 2010 (SI 2010/1001)[28]

They are shown in Table 1. Table 1 includes the number of permitted exceedences in any given year (where applicable).

Table 1. Air Quality Objectives included in Regulations for the purpose of Local Air Quality Management in England.

Pollutant	**Concentration**	**Measured as**	Date to be achieved by
Benzene	16.25 μgm^{-3}	Running annual mean	31.12.2003
	5.00 μgm^{-3}	Running annual mean	31.12.2010
1,3-Butadiene	2.25 μgm^{-3}	Running annual mean	31.12.2003
Carbon monoxide	10.0 μgm^{-3}	Running 8-hour mean	31.12.2003
Lead	0.5 $\mu gm^{-3}3$	Annual mean	31.12.2004
	0.25 μgm^{-3}	Annual mean	31.12.2008
Nitrogen dioxide	200 μgm^{-3} not to be exceeded more than 18 times a year	1-hour mean	31.12.2005
	40 μgm^{-3}	Annual mean	31.12.2005
Particles PM_{10} (gravimetric)	50 μgm^{-3}, not to be exceeded more than 35 times a year	24-hour mean	31.12.2004

Pollutant	**Concentration**	**Measured as**	Date to be achieved by
	40 μgm^{-3}	Annual mean	31.12.2004
Particles $PM_{2.5}$ (gravimetric) (not currently included in regulations)	25 μgm^{-3} (target)	Annual mean	2020
Sulphur dioxide	350 μgm^{-3}, not to be exceeded more than 24 times a year	1-hour mean	31.12.2004
	125 μgm^{-3}, not to be exceeded more than 3 times a year	24-hour mean	31.12.2004
	266 μgm^{-3}, not to be exceeded more than 35 times a year	15-minute mean	31.12.2005

1.4 Summary of Previous Review and Assessments

Six AQMAs were designated in North West Leicestershire during the first round of review and assessment for the level of nitrogen dioxide concentrations. After Further Assessments it was determined that only two of these locations required AQMA designations and the remaining four were revoked. The Update and Screening Assessment (USA) undertaken in 2006 [1] concluded that these two sites should remain AQMAs and identified three additional locations where Detailed Assessments should be undertaken to determine whether new AQMAs were required for nitrogen dioxide concentrations. The two AQMAs designated during the first round are presented in Figure 2 and Figure 3.

The Detailed Assessment [6] undertaken in September 2007 of the three locations identified as possible areas for AQMAs in the USA 2006 [1], the three locations were High Street/Bondgate in Castle Donington, Broom Leys Road, Coalville and Bardon Road, Coalville, found that exceedences of the nitrogen dioxide objective were occurring in Castle Donington at properties located next to the carriageway along High Street and Bondgate due to traffic emissions. Monitoring at both locations in Coalville identified nitrogen dioxide concentrations that exceeded the mean annual objective during 2005, 2006 and 2007. The Detailed Assessment concludes that AQMAs should be designated at all three locations. As a result of these reports, two additional AQMAs were designated; the first in Castle Donington, presented in Figure 4, and the second covering Broom Leys Road and Bardon Road in Coalville, presented in Figure 5.

The Air Quality Progress Report conducted in April 2008 [7] recommended that a detailed assessment of the village of Copt Oak and the area surrounding East Midlands airport be undertaken to determine if AQMA's should be determined at these locations.

The Detailed Assessment of Copt Oak published in January 2009 [9] found that an AQMA should be declared and that the area should cross the district boundary to include an area within the borough of Hinckley and Bosworth as shown in Figure 6.

The Detailed assessment of East Midlands airport published in March 2009 [8] concluded that the Air quality objective for NO_2 would not be exceeded within 1000m of the airport as a result of air traffic emissions.

The further assessment of Bardon Road, Coalville published in February 2009 [10] supported the original declaration of the AQMA comprising the four residential properties at Broom Leys Junction and the one hundred and seventy two residential properties on Bardon Road.

The further assessment of High Street Castle Donington published in April 2009 [11] supported the original declaration of the AQMA comprising ninety one residential properties on High Street and Bondgate, Castle Donington.

The update and screening assessment published October 2009 [12] found that a detailed assessment for SO_2 was required in some areas of the district in relation to the burning of solid fuel, to which this report relates. The report also recommended that the M1 AQMA is expanded to include an exceedence of the 1-hour mean objective for NO_2 as the yearly mean has exceeded 60μgm^{-3}.

The Progress Report published in April 2010 [13] found no significant change in the district.

A Detailed Assessment for SO_2 was conducted in 2010 [14]. This found that solid fuel usage within off-gas areas of the district was insufficient to warrant further investigation.

A Detailed assessment of the M1 AQMA conducted in 2011 [16] found that most of the declared area could be revoked as there is either no relevant receptor or the annual mean air quality standard for NO_2 is not being exceeded.

A Detailed Assessment of the Coalville AQMA conducted in 2011 [15] found that the declared area could be reduced to the declared area of Stephenson Way as the annual mean air quality standard for NO_2 is not being exceeded along Bardon Road.

The 2011 progress report [17] found that Broomleys junction in the Coalville AQMA exceeded the 1-hour mean air quality standard for NO_2 and recommended that a detailed assessment be undertaken.

The progress report also found that the current air quality action plan is insufficient and needs to be updated.

The 2011 detailed assessment of 1-hour Mean Air Quality Standard at Broomleys junction Coalville[18] found that the 1-hour mean air quality standard was being exceeded and the AQMA should be amended.

The 2012 detailed assessment of Castle Donington[20] found that a large proportion of the AQMA was not exceeding the air quality standard and recommended the AQMA be amended.

The 2012 Further assessment of Copt Oak [21] found that a large proportion of the AQMA was not exceeding the Air Quality Standard and recommended the AQMA be amended.

The 2012 Detailed assessment of Kegworth [22] found that it was likely that most of the AQMA was exceeding the Air Quality Standard and recommended a new monitoring location was installed in the north of the AQMA.

The 2013 Further assessment of Coalville AQMA[23] found that some of its area was not exceeding the annual mean or hourly mean air quality standards for NO_2. The report recommended that a traffic survey be undertaken to further inform action planning

2 Methodology

2.1 Projecting measured annual mean roadside nitrogen dioxide concentrations to future years

The technical guidance LAQM.TG(09) [39] defines a method for projecting the NO_2 concentration to future years in paragraph 2.13 page 2-3 and box 2.1 on page 2-4. A correction to box 2.1 was published in an Errata published in 2010 [40]. The corrected version of Box 2.1 is reproduced in Table 2 for reference.

Table 2. Box 2.1 from *Errata to LAQM.TG(09): Is the example in box 2.1 of TG(09) correct?*

Box 2.1: Projecting measured annual mean roadside nitrogen dioxide concentrations to future years

Year	Adjustment factor to be applied				Example:
	Central London	Inner London	Outer London	Rest of UK	
2008	1.000	1.000	1.000	1.000	The measured NO_2 concentration at a roadside site in Outer London in 2009 is 45.8 µgm^{-3}. The projected concentration for 2010 would be $45.8 \times \left(\frac{0.832}{0.916}\right) = 41.6\ \mu gm^{-3}$ Roadside locations are typically within 1 to 5 metres of the kerbside, but may extend up to 15 metres depending upon the road configuration and traffic flow.
2009	0.940	0.926	0.916	0.916	
2010	0.881	0.853	0.832	0.832	
2011	0.824	0.799	0.780	0.783	
2012	0.766	0.746	0.729	0.735	
2013	0.709	0.692	0.678	0.687	
2014	0.652	0.639	0.626	0.639	
2015	0.595	0.585	0.575	0.591	
2016	0.554	0.549	0.542	0.557	
2017	0.513	0.513	0.508	0.523	
2018	0.472	0.477	0.475	0.489	
2019	0.430	0.441	0.442	0.454	
2020	0.389	0.405	0.408	0.420	

Modified from Box 2.1 in *Errata to TG(09): Is the example in Box 2.1 of TG(09) correct?* [40]

From the example given in Box 2.1 it is believed the projection factors should be used as follows

$$Y_p = {}_m \times \frac{AF_p}{AF_m}$$

Where:

Y_p = NO_2 concentration for the Projected Year

Y_m = Measured NO_2 Concentration

AF_p = Adjustment factor for the year to be projected

AF_m = Adjustment factor for the year NO_2 was measured

2.2 Façade Correction

Some diffusion tubes required a façade correction; the corrections were undertaken using the procedure outlined in Box 2.3: Predicting nitrogen dioxide concentrations at different distances from road of the technical guidance (reproduced in Table 3)

Table 3. Box 2.3: Predicting nitrogen dioxide concentrations at different distances from roads?

Box 2.3: Predicting nitrogen dioxide concentrations at different distances from roads

A method has been developed to allow NO_2 measurements made at one distance from a road to be used to predict concentrations at a different distance from the same road. It is appropriate for distances between 0.1 m and 140 m of the kerb.

Step 1: Identify the local background concentration in μgm^{-3}, either from local monitoring or from the national maps published at www.airquality.co.uk. (Note that the background concentration must be less than the measured concentration).

Step 2: apply the following calculation

$$C_z = \left(\frac{C_y - C_b}{-0.5476 \times \ln D_y + 2.7171} \right) \times -0.5476 \times \ln D_z + 2.7171 + C_b$$

Where:

- C_z is the total predicted concentration (μgm^{-3}) at distance D_z;
- C_y is the total measured concentration (μgm^{-3}) at distance D_y;
- C_b is the background concentration (μgm^{-3});
- D_y is the distance from the kerb at which concentrations were measured;
- D_z is the distance from the kerb (m) at which concentrations are to be predicted.
- *Ln(D)* is the natural log of the number D.

Results derived in this way will have a greater uncertainty than the measured data. Further assistance with this procedure and interpretation of the results can be obtained from the Review and Assessment helpdesk (http://laqm.defra.gov.uk/helpdesks.html).

Calculator

The equation above is available as a simple calculator (available at http://laqm.defra.gov.uk/tools-monitoring-data/no2-falloff.html). This is set up to work from 0.1 to 50 m from the kerb, as this is the range that is likely to be relevant for Local Air Quality Management (LAQM) work. Kerbside sites should be treated as being at 0.1 m from the kerb. The calculator works for receptors either closer to or further from the kerb than the monitor. The greater the distance between the receptor and monitor, the greater the uncertainty in the derived receptor concentration. It is therefore recommended that if the receptor is further from the kerb than the monitor it should be no more than 20m away. If the receptor is closer to the kerb, then it should be no more than 10 m from the monitor.

Modified from Box 2.3 page 2-6 of the technical Guidance 2009 [39] (modification are improved layout of equation and insertion of updated hyperlinks where footnotes are present in the original.

2.3 Annualisation

Where only short-term periods of monitoring data are available, the results may be adjusted to estimate an annual mean concentration using the approach set out in Box 3.2: Estimation of annual mean concentrations from short-term monitoring data of the technical guidance LAQM.TG(09) [39] (reproduced in Table 4).

Table 4. Box 3.2: Estimation of annual mean concentrations from short-term monitoring data

Box 3.2: Estimation of annual mean concentrations from short-term monitoring data

Example

It has only been possible to carry out a monitoring survey (automatic or diffusion tube) at site **S** for six months between July and December 2008. The measured mean concentration **M** for this period is 30.2μgm^{-3}. How can this be used to estimate the annual mean for this location?

Adjustment to estimate annual mean

The adjustment is based on the fact that patterns in pollutant concentrations usually affect a wide region. Thus if a six month period is above average at one place it will almost certainly be above average at other locations in the region. The adjustment procedure is as follows:

1. Identify two to four nearby, long-term, continuous monitoring sites, ideally those forming part of the national network. These should be background sites to avoid any very local effects that may occur at roadside sites, and should, wherever possible lie within a radius of about 50 miles.
2. Obtain the annual means, **Am**, for the calendar year for these sites, 2008 in this example.
3. Work out the period means, **Pm**, for the period of interest, in this case July to December 2008. [It may be necessary to use unratified automatic data.]
4. Calculate the ratio, **R**, of the annual mean to the period mean $\left(\frac{Am}{Pm}\right)$ for each of the sites.
5. Calculate the average of these ratios, $\mathbf{R_a}$. This is then the adjustment factor.
6. Multiply the measured period mean concentration **M** by this adjustment factor $\mathbf{R_a}$ to give the estimate of the annual mean for 2008.

Long term site	Annual mean 2008 (Am)	Period Mean 2008 (Pm)	Ratio $\left(\frac{Am}{Pm}\right)$
A	28.6	29.7	0.963
B	22.0	22.8	0.965
C	26.9	28.9	0.931
D	23.7	25.9	0.915
		Average (R_a)	0.944

For this example the best estimate of the annual mean for site **S** in 2008 will be **M** × $\mathbf{R_a}$ = 30.2 x 0.944 = 28.5μgm^{-3}.

Notes

Monitoring data for the long-term sites must have adequate data capture rates: above 90% is preferable; sites with data capture below 75% should not be used.

It may be appropriate to use diffusion tube results from a long-term survey to adjust short-term diffusion tube results. To allow for the greater uncertainty of diffusion tubes results from four or more sites should be used. Ensure that the tubes are from the same supplier using the same method of preparation.

If the short-term period covers, for instance, February to June 2009, and the work is being carried out in August 2009, then an annual mean for 2009 will not be available. The calculation can then be carried out using the ratio to the 2008 annual mean, but the result is then an estimate of the 2008 annual mean at the short-term site.

Modified from Box 3.2 page 3-4 of the technical Guidance 2009 [39].

3 New Monitoring Data

3.1 Summary of Monitoring Undertaken

3.1.1 Automatic Monitoring Sites

3.1.1.1 Council Run Sites

Currently North West Leicestershire District Council operates 2 automatic monitors in the district located at Castle Donington, Coalville. These monitors are all located with AQMAs declared for exceedences of the nitrogen dioxide air quality standards.

The Council cease operating an automatic monitor in Copt Oak in may.

Details of the sites are shown in Table 5. Full Data is available from North West Leicestershire District Council Website [52]

All 3 monitors are API 200A NO_x analysers

3.1.1.2 Site operated by third parties

Aggregate industries operate 1 partisol PM_{10} monitor located on Bradgate Drive in Coalville for environmental monitoring relating to their environmental permit.

East Midlands Airport operate an automatic monitor for NO_2 as part of their environmental monitoring program.

Details of the sites are shown in Table 5.

Figure 7 Map of Automatic Monitoring Sites

3.1.2 Non-Automatic Monitoring Sites

3.1.2.1 Council Run Sites

The council undertakes extensive diffusion tube monitoring within its AQMAs. Details of the tubes are shown in Table 6. Full Data is available from North West Leicestershire District Council Website [51]

3.1.2.2 East Midlands Airport run sites

The East Midlands Airport undertakes extensive diffusion tube monitoring in the area of the airport. Details of the tubes are shown in Table 7..

B i.e. data capture for the full calendar year (e.g. if monitoring was carried out for six months the maximum data capture for the full calendar year would be 50%.)

C If the period of valid data is less than 90%, include the 99.8th percentile of hourly means in brackets

*Number of exceedences for previous years are optional.

3.2.1.2 Diffusion Tube Monitoring Data

An overview of the data is show in Table 10 Façade corrections of relevant tubes is shown in Table 11. Full monitoring data is available in Appendix B

Coalville
Tubes 06N 35N 36N 42N 43N are located within the AQMA

Tubes 06N and 36N exceeded the annual mean AQS for NO_2

Tubes 43N and 35N did not exceed the NO_2 AQS

Tube 42N did not exceed the NO_2 AQS but is close to it.

Castle Donington
Tubes 12N 14N 16N 40N are not located within an AQMA and did not exceed the air quality standard

Tube 41N did not exceed the NO_2 AQS but is close to it however when the results are façade corrected to the nearest receptor it is unlikely that the NO_2 AQS is being exceeded at the nearest receptor.

Tubes 19N are located at the northern most extent of an AQMA and did not exceed the NO_2 AQS

Tube 18N is located on the façade of a property within an AQMA and significantly exceeded athe NO_2 AQS

Tubes 17N 37N 38N are located within an AQMA, they did not exceed the AQS but are close to it.

Copt Oak
Tubes 08N 33N 34N are not within an AQMA and did not exceed the NO_2 AQS

Tubes 09N 32N are not located within an AQMA but did exceed the NO_2 AQS however there are no residential premises within 50m

Tube 44N is not in an AQMA and did not exceed the NO_2 AQS however it was close to it. Façade correction of the data to the nearest residential

property shows it is unlikely that the nearest residential property is exceeding the AQS.

Tubes 45N is located within an AQMA but did not exceed the NO_2 AQS. However it is not possible to assess the nearest residential property from this tube due to its proximity to the M1

Kegworth

Tube 20N is located within the AQMA and did not exceed the NO_2 AQS

Tube 22N is located on the façade of a property within the AQMA the tube did not exceed the NO_2 AQS however the tube did exceed 36μgm^{-3} .

Tube 46N is located on the façade of a property within the AQMA and exceeded the NO_2 AQS

Tube 47N and 48N are located within the AQMA and both exceeded the NO_2 AQS. When the sites are façade corrected the NO_2 AQS was not exceeded at the boundary of the nearest receptors however the neatest receptors are estimated to be above 36μgm^{-3}

Tube 23N is not located with in an AQMA. The site is significantly below the NO_2 AQS.

M1 (Mole Hill Farm and Long Whatton)

Tube 26N is located on the façade of a property in an AQMA. The site did not exceed the NO_2 AQS but was above 36μgm^{-3}

Tube 39N is not located within an AQMA and is significantly below the NO_2 AQS

Other Tubes

Tube 31N is located in Sinope near to the A511. The did not exceed the NO_2 AQS but was above 36μgm^{-3} . When a façade correction is applied the nearest receptor is significantly below the NO_2 AQS

Tube 49N is located on central road Hugglescote. The period mean is significantly below the NO_2 AQS. The annualised mean is significantly below the NO_2 AQS. When a façade correction is applied tot both the

period and annualised means the nearest receptor is significantly below the NO_2 AQS

Tube 50N is located on central road|station road crossroads in Hugglescote. The period mean is below the NO_2 AQS but exceeded 36μgm^{-3}. The annualised mean is below the NO_2 AQS but exceeded 36μgm^{-3}. When a façade correction is applied to both the period and annualised means the nearest receptor is significantly below the NO_2 AQS

3.2.3 Sulphur Dioxide (SO_2)

This authority does not monitor for this pollutant

3.2.4 Benzene

This authority does not monitor for this pollutant

3.2.5 Other Pollutants Monitored

This authority does not monitor for any other pollutants

3.3 Summary of Compliance with AQS Objectives

This authority has recorded exceedences of the annual mean Air Quality Standard(AQS) for NO_2 at several locations within its declared AQMA's

The authority has not detected an exceedence of the 1-hour mean AQS for NO_2 within the Coalville AQMA. It should be noted that the recorded annual mean at Broomleys junction has never exceeded 60 μgm^{-3}.

Exceedences of 60 μgm^{-3} were historically detected near to molehill farm however these monitoring locations have been discontinued. The diffusion tube on the façade of molehill farm house did not record an exceedence of the annual mean AQS however the bias adjusted annual mean did exceed 36μgm^{-3}

The diffusion tube placed directly over the M1 near to Copt Oak also recorded an exceedence of the annual mean AQS for NO_2 however there are no relevant receptors within 50m of the site. The nearest domestic property to the site is End Cottage. There is a diffusion tube on the façade of this property (08N) which did not record an exceedence of the annual mean AQS.

North West Leicestershire District Council has examined the results from monitoring in the district.

- Concentrations within the Castel Donington AQMA still exceed the annual mean standard for nitrogen dioxide and the AQMA should remain.
- Concentrations within the Kegworth AQMA still exceed the annual mean standard for nitrogen dioxide and the AQMA should remain.
- Concentrations within the M1 Mole hill AQMA still exceed the annual mean standard and hourly mean standard for nitrogen dioxide and the AQMA should remain.
- Concentrations within the Copt Oak AQMA still exceed the annual mean standard for nitrogen dioxide and the AQMA should remain.
- Concentrations within the Coalville AQMA still exceed the annual mean standard for nitrogen dioxide and the AQMA should remain.

Concentrations outside of the AQMAs are all below the objectives at relevant locations, therefore there is no need to proceed to a Detailed Assessment.

4 New Local Developments

4.1 Road Traffic Sources

There are no new sources since he last update and screening assessment

4.2 Other Transport Sources

There are no new sources since the last update and screening assessment

4.3 Industrial Sources

There are no new sources since the last update and screening assessment

4.4 Commercial and Domestic Sources

There are no new sources since the last update and screening assessment

4.5 New Developments with Fugitive or Uncontrolled Sources

There are no new sources since the last update and screening assessment

North West Leicestershire District Council confirms that there are no new or newly identified local developments which may have an impact on air quality within the Local Authority area.

North West Leicestershire District Council confirms that all the following have been considered:

- **Road traffic sources**
- **Other transport sources**
- **Industrial sources**
- **Commercial and domestic sources**
- **New developments with fugitive or uncontrolled sources.**

5 Local / Regional Air Quality Strategy

There is not currently a local or regional air quality strategy covering North West Leicestershire District

6 Air Quality Planning Policies

North West Leicestershire District council has not adopted policies specifically to deal with air quality however Policy E3 of the adopted Local Plan seeks to protect residential amenities by not permitting development which by virtue of “smell, fumes, smoke, soot, ash, grit…” would be injurious to residential amenity.

7 Local Transport Plans and Strategies

The Council is currently working with Leicestershire County Council as the Highway authority to develop action plan and for the actions to be included in the Local transport plan 3 implementation plans.

8 Implementation of Action Plans

All action in the council’s action plan have either been completed or have stalled waiting for other agencies to progress actions. It is therefore necessary for the council to review its action plan

The Council is currently working with Leicestershire County Council as the Highway authority to develop a new action plan and for the actions to be included in the Local transport plan 3 implementation plans.

9 Conclusions and Proposed Actions

Air quality objectives are still being exceeded within air quality management areas

9.1 Proposed Actions

- Publish Coalville traffic assessment as recommended by the 2013 Further assessment of Coalville AQMA[23]
- Publish a revised air quality action plan

11 Appendices

Appendix A QA:QC Data

- QA/QC of automatic monitoring

  The analyser at Coalville is an API 200 chemiluminescence analyser,

  Routine instrument calibrations are conducted once per month, which involve zero and span checks, a written record of the gas analyser diagnostics and a general visual inspection of all equipment is undertaken.

- Data retrieval and daily data checking

  Data from the monitoring station is retrieved and processed on a data logger as 15-minute mean data. The logger is interrogated via a Siemens TC35i GSM modem at 8-hourly intervals by the ENVIEW 2000 software hosted at TRL. This is used to retrieve, check and archive data.

  TRLs internal QA/QC procedures require all data to be backed up on a secure server and all documentation associated with each site to be uniquely identified and securely stored to provide an audit trail.

  Daily data inspections are undertaken during office hours using the facilities of the Data Management System. Initial observations of the Management System indicate whether the site has been contacted during its nominated 'poll time' overnight. If this has not been successful a manual poll of the site may be required. If this is not successful further investigation of the communications integrity will be required to establish contact with the site modem and data logger.

  Three day plots of recorded data are viewed for the requested site, and these are inspected and assessed for continuity, validity, minimum and maximum values, date and time, power

failures and general integrity. All anomalies are recorded on the Daily Check sheet, as required. Any anomalies or queries arising from daily inspection of data, or system operation, are brought to the attention of the Project Manager who will evaluate the situation, and initialise any necessary action. In the event that the PM is not available, contact will be made with the next available senior person within the monitoring team. Any issues identified with equipment operation will be referred to the client for attention within 24 hours (excluding weekends).

On a weekly basis, data are examined using summary statistics and outlier analysis to establish data validity. In the event that unusual data episodes are recorded, these would be routinely examined over longer data periods to establish their impact on trends, but would also be cross referenced with data peaks and troughs recorded at other national monitoring stations. In addition, integrity and validity of data logger clock times are checked, and any significant errors recorded in the Data Management System logbook.

All site data recorded through the Data Management System is archived on TRLs Network. The data is backed up daily, and the TRL IT Department maintains these data within their long-term and secure archives. This secures all data in the event of any system failure.

- Data calibration and ratification

  Data is ratified as per AURN recommended procedures. The calibration and ratification process for automatic gas analysers corrects the raw dataset for any drift in the zero baseline and the upper range of the instrument. This is done using a Microsoft Excel-based calibration and ratification file which incorporates the zero and span check information from the calibration visits. The zero reading recorded during the calibration visits is used to adjust any offset of the baseline of

the data. The difference between the span value obtained between one calibration visit and the next visit is used to calculate a factor. This change is assumed to occur at the same rate over the period between calibrations and as such the factor is used as a linear data scaler. This effectively results in the start of the period having no factor applied and the end of the period being scaled with the full factor with a sliding scale of the factor in-between. After applying the calibration factors, it is essential to screen the data, by visual examination, to see if they contain any unusual measurements or outliers. Errors in the data may occur as a result of equipment failure, human error, power failures, interference or other disturbances. Data validation and ratification is an important step in the monitoring process. Ratification involves considerable knowledge of pollutant behaviour and dispersion, instrumentation characteristics, field experience and judgement.

On completion of this data correction procedure, these data were converted to hourly means and a summary of these data were provided to North West Leicestershire District Council.

Appendix B Diffusion Tube Monitoring Data
