

2015 Air Quality Update and Screening Assessment

for North West Leicestershire District Council

In fulfilment of

Part IV of the Environment Act 1995

Local Air Quality Management

Date: January 2016

North West Leicestershire District Council

Local Authority Officer	Gareth Rees
Department	Street Action Team Community Services
Address	North West Leicestershire District Council, Council Offices, Whitwick Road, Coalville, Leicestershire, LE67 3FJ
Telephone	01530 454545
e-mail	Environmental.protection@nwleicestershire.gov.uk
Report Reference number	NWLDC-USA-2015
Date	January 2016

Executive Summary

This Air Quality Update and Screening Assessment 2015 fulfils North West Leicestershire District Council's commitment to the Local Air Quality Management (LAQM) process. This report follows the requirements of the DEFRA guidance LAQM.TG(09) [38] and is the start of the sixth round of Review and Assessment undertaken by the District Council.

This Updating and Screening Assessment reviews the data collected during the 2014 calendar year and changes which may have occurred within the district which may affect air quality, and any improvements that have been made in the methods of predicting air quality during 2012, 2013 and 2014.

If areas are identified as not meeting the Air Quality Objectives and there is relevant exposure, then it will be necessary to proceed to a Detailed Assessment for that particular pollutant in the area identified.

The report indicates that the annual mean objective for NO₂ will not be achieved within the five previously declared AQMA's

This authority must :

1 Introduction

1.1 Description of Local Authority Area

Figure 1. Map of North West Leicestershire District

North West Leicestershire District Council

North West Leicestershire lies in the East Midlands Region and is both the name and geographical location. The district is situated in the heart of the National Forest and lies between Leicester, Burton-on-Trent, Derby and Nottingham, covering approximately 280Km² (approximately 108 square miles). The district is mostly rural with a large extent of industry historically from coal mining, but more recently with Nottingham East Midlands Airport and large quarries.

The 2011 census found the population of the district to be 93,468[50]; the population is mainly distributed in the principle towns of Coalville and Ashby-de-la-Zouch; and the large villages of Castle Donington, Kegworth and Ibstock.

Three established main roads run through the district,

- the M42/A42 between Birmingham and Nottingham,
- the M1, and
- the A511 from Leicester to Burton-on-Trent.

1.2 Purpose of Report

This report fulfils the requirements of the Local Air Quality Management process as set out in Part IV of the Environment Act (1995), the Air Quality Strategy for England, Scotland, Wales and Northern Ireland 2007 and the relevant Policy and Technical Guidance documents. The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where exceedences are considered likely, the local authority must then declare an Air Quality Management Area (AQMA) and prepare an Air Quality Action Plan (AQAP) setting out the measures it intends to put in place in pursuit of the objectives.

The objective of this Updating and Screening Assessment is to identify any matters that have changed which may lead to risk of an air quality objective being exceeded. A checklist approach and screening tools are used to identify significant new sources or changes and whether there is a

need for a Detailed Assessment. The USA report should provide an update of any outstanding information requested previously in Review and Assessment reports.

1.3 Air Quality Objectives

The air quality objectives applicable to LAQM in England are set out in the Air Quality (England) Regulations 2000 (SI 928), The Air Quality (England) (Amendment) Regulations 2002 (SI 3043), and are shown in Table 1.1.

This table shows the objectives in units of microgrammes per cubic metre $\mu\text{g.m}^{-3}$ (milligrammes per cubic metre, mg.m^{-3} for carbon monoxide) with the number of exceedences in each year that are permitted (where applicable).

Table 1. Air Quality Objectives included in Regulations for the purpose of LAQM in England

Pollutant	Air Quality Objective		Date to be achieved by
	Concentration	Measured as	
Benzene	16.25 $\mu\text{g.m}^{-3}$	Running annual mean	31.12.2003
	5.00 $\mu\text{g.m}^{-3}$	Running annual mean	31.12.2010
1,3-Butadiene	2.25 $\mu\text{g.m}^{-3}$	Running annual mean	31.12.2003
Carbon monoxide	10.0 mg.m^{-3}	Running 8-hour mean	31.12.2003
Lead	0.5 $\mu\text{g.m}^{-3}$	Annual mean	31.12.2004
	0.25 $\mu\text{g.m}^{-3}$	Annual mean	31.12.2008
Nitrogen dioxide	200 $\mu\text{g.m}^{-3}$ not to be exceeded more than 18 times a year	1-hour mean	31.12.2005
	40 $\mu\text{g.m}^{-3}$	Annual mean	31.12.2005
Particles (PM ₁₀) (gravimetric)	50 $\mu\text{g.m}^{-3}$, not to be exceeded more than 35 times a year	24-hour mean	31.12.2004
	40 $\mu\text{g.m}^{-3}$	Annual mean	31.12.2004
Sulphur dioxide	350 $\mu\text{g.m}^{-3}$, not to be exceeded more than 24 times a year	1-hour mean	31.12.2004
	125 $\mu\text{g.m}^{-3}$, not to be exceeded more than 3 times a year	24-hour mean	31.12.2004
	266 $\mu\text{g.m}^{-3}$, not to be exceeded more than 35 times a year	15-minute mean	31.12.2005

1.4 Summary of Previous Review and Assessments

Six AQMAs were designated in North West Leicestershire during the first round of review and assessment for the level of nitrogen dioxide concentrations. After Further Assessments it was determined that only two

of these locations required AQMA designations and the remaining four were revoked. The Update and Screening Assessment (USA) undertaken in 2006 [1] concluded that these two sites should remain AQMAs and identified three additional locations where Detailed Assessments should be undertaken to determine whether new AQMAs were required for nitrogen dioxide concentrations. The two AQMAs designated during the first round are presented in Figure 2 and Figure 3

The Detailed Assessment [6] undertaken in September 2007 of the three locations identified as possible areas for AQMAs in the USA 2006 [1], the three locations were High Street/Bondgate in Castle Donington, Broom Leys Road, Coalville and Bardon Road, Coalville, found that exceedences of the nitrogen dioxide objective were occurring in Castle Donington at properties located next to the carriageway along High Street and Bondgate due to traffic emissions. Monitoring at both locations in Coalville identified nitrogen dioxide concentrations that exceeded the mean annual objective during 2005, 2006 and 2007. The Detailed Assessment concludes that AQMAs should be designated at all three locations. As a result of these reports, two additional AQMAs were designated; the first in Castle Donington, presented in Figure 4, and the second covering Broom Leys Road and Bardon Road in Coalville, presented in Figure 5

The Air Quality Progress Report conducted in April 2008 [7] recommended that a detailed assessment of the village of Copt Oak and the area surrounding East Midlands airport be undertaken to determine if AQMAs should be determined at these locations.

The Detailed Assessment of Copt Oak published in January 2009 [9] found that an AQMA should be declared and that the area should cross the district boundary to include an area within the borough of Hinckley and Bosworth as shown in Figure 6.

The Detailed assessment of East Midlands airport published in March 2009 [8] concluded that the Air quality objective for NO₂ would not be exceeded within 1000m of the airport as a result of air traffic emissions.

North West Leicestershire District Council

The further assessment of Bardon Road, Coalville published in February 2009 [10] supported the original declaration of the AQMA comprising the four residential properties at Broom Leys Junction and the one hundred and seventy two residential properties on Bardon Road.

The further assessment of High Street Castle Donington published in April 2009 [11] supported the original declaration of the AQMA comprising ninety one residential properties on High Street and Bondgate, Castle Donington.

The update and screening assessment published October 2009 [11] found that a detailed assessment for SO₂ was required in some areas of the district in relation to the burning of solid fuel, to which this report relates. The report also recommended that the M1 AQMA is expanded to include an exceedence of the 1-hour mean objective for NO₂ as the yearly mean has exceeded 60µgm⁻³.

The Progress Report published in April 2010 [11] found no significant change in the district.

A Detailed Assessment for SO₂ was conducted in 2010 [12]. This found that solid fuel usage within off-gas areas of the district was insufficient to warrant further investigation.

A Detailed assessment of the M1 AQMA conducted in 2011 [14] found that most of the declared area could be revoked as there is either no relevant receptor or the annual mean air quality standard for NO₂ is not being exceeded.

A Detailed Assessment of the Coalville AQMA conducted in 2011 [13] found that the declared area could be reduced to the declared area of Stephenson Way as the annual mean air quality standard for NO₂ is not being exceeded along Bardon Road.

North West Leicestershire District Council

The 2011 progress report [15] found that Broomleys junction in the Coalville AQMA exceeded the 1-hour mean air quality standard for NO₂ and recommended that a detailed assessment be undertaken.

The progress report also found that the current air quality action plan is insufficient and needs to be updated.

The 2011 detailed assessment of 1-hour Mean Air Quality Standard at Broomleys junction Coalville[16] found that the 1-hour mean air quality standard was being exceeded and the AQMA should be amended.

The 2012 detailed assessment of Castle Donington[18] found that a large proportion of the AQMA was not exceeding the air quality standard and recommended the AQMA be amended.

The 2012 Further assessment of Copt Oak [19] found that a large proportion of the AQMA was not exceeding the Air Quality Standard and recommended the AQMA be amended.

The 2012 Detailed assessment of Kegworth [20] found that it was likely that most of the AQMA was exceeding the Air Quality Standard and recommended a new monitoring location was installed in the north of the AQMA.

The 2013 Further assessment of Coalville AQMA[21] found that some of its area was not exceeding the annual mean or hourly mean air quality standards for NO₂. The report recommended that a traffic survey be undertaken to further inform action planning

2 Methodology

2.1 Projecting measured annual mean roadside nitrogen dioxide concentrations to future years

The technical guidance LAQM.TG(09) [38] defines a method for projecting the NO₂ concentration to future years in paragraph 2.13 page 2-3 and box 2.1 on page 2-4. A correction to box 2.1 was published in an Errata published in 2010 [39]. The corrected version of Box 2.1 is reproduced in Table 2 for reference.

Table 2. Box 2.1 from Errata to LAQM.TG(09): Is the example in box 2.1 of TG(09) correct?

Box 2.1: Projecting measured annual mean roadside nitrogen dioxide concentrations to future years					
Year	Adjustment factor to be applied				Example:
	Central London	Inner London	Outer London	Rest of UK	
2008	1.000	1.000	1.000	1.000	The measured NO ₂ concentration at a roadside site in Outer London in 2009 is 45.8 µg m ⁻³ . The projected concentration for 2010 would be $45.8 \times \left(\frac{0.832}{0.916} \right) = 41.6 \mu\text{g m}^{-3}$ Roadside locations are typically within 1 to 5 metres of the kerbside, but may extend up to 15 metres depending upon the road configuration and traffic flow.
2009	0.940	0.926	0.916	0.916	
2010	0.881	0.853	0.832	0.832	
2011	0.824	0.799	0.780	0.783	
2012	0.766	0.746	0.729	0.735	
2013	0.709	0.692	0.678	0.687	
2014	0.652	0.639	0.626	0.639	
2015	0.595	0.585	0.575	0.591	
2016	0.554	0.549	0.542	0.557	
2017	0.513	0.513	0.508	0.523	
2018	0.472	0.477	0.475	0.489	
2019	0.430	0.441	0.442	0.454	
2020	0.389	0.405	0.408	0.420	

Modified from Box 2.1 in Errata to TG(09): Is the example in Box 2.1 of TG(09) correct? [39]

From the example given in Box 2.1 it is believed the projection factors should be used as follows

$$Y_p = Y_m \times \frac{AF_p}{AF_m}$$

Where:

Y_p = NO₂ concentration for the Projected Year

Y_m = Measured NO₂ Concentration

AF_p = Adjustment factor for the year to be projected

AF_m = Adjustment factor for the year NO₂ was measured

2.2 Façade Correction

Some diffusion tubes required a façade correction; the corrections were undertaken using the procedure outlined in Box 2.3: Predicting nitrogen dioxide concentrations at different distances from road of the technical guidance (reproduced in Table 3)

Table 3. Box 2.3: Predicting nitrogen dioxide concentrations at different distances from roads?

Box 2.3: Predicting nitrogen dioxide concentrations at different distances from roads	
<p>A method has been developed to allow NO₂ measurements made at one distance from a road to be used to predict concentrations at a different distance from the same road. It is appropriate for distances between 0.1 m and 140 m of the kerb.</p> <p>Step 1: Identify the local background concentration in µgm⁻³, either from local monitoring or from the national maps published at www.airquality.co.uk. (Note that the background concentration must be less than the measured concentration).</p> <p style="text-align: center;">Step 2: apply the following calculation</p> $C_z = \left(\frac{C_y - C_b}{-0.5476 \times \ln(D_y) + 2.7171} \right) \times (-0.5476 \times \ln(D_z) + 2.7171) + C_b$ <p>Where:</p> <ul style="list-style-type: none"> C_z is the total predicted concentration (µgm⁻³) at distance D_z; C_y is the total measured concentration (µgm⁻³) at distance D_y; C_b is the background concentration (µgm⁻³); D_y is the distance from the kerb at which concentrations were measured; D_z is the distance from the kerb (m) at which concentrations are to be predicted. Ln(D) is the natural log of the number D. <p>Results derived in this way will have a greater uncertainty than the measured data. Further assistance with this procedure and interpretation of the results can be obtained from the Review and Assessment helpdesk (http://laqm.defra.gov.uk/helpdesks.html).</p> <p>Calculator</p> <p>The equation above is available as a simple calculator (available at http://laqm.defra.gov.uk/tools-monitoring-data/NO2-falloff.html). This is set up to work from 0.1 to 50 m from the kerb, as this is the range that is likely to be relevant for Local Air Quality Management (LAQM) work. Kerbside sites should be treated as being at 0.1 m from the kerb. The calculator works for receptors either closer to or further from the kerb than the monitor. The greater the distance between the receptor and monitor, the greater the uncertainty in the derived receptor concentration. It is therefore recommended that if the receptor is further from the kerb than the monitor it should be no more than 20m away. If the receptor is closer to the kerb, then it should be no more than 10 m from the monitor.</p>	

Modified from Box 2.3 page 2-6 of the technical Guidance 2009 [38] (modification are improved layout of equation and insertion of updated hyperlinks where footnotes are present in the original).

2.3 Annualisation

Where only short-term periods of monitoring data are available, the results may be adjusted to estimate an annual mean concentration using the approach set out in Box 3.2: Estimation of annual mean concentrations from short-term monitoring data of the technical guidance LAQM.TG(09) [38] (reproduced in Table 4).

Table 4. Box 3.2: Estimation of annual mean concentrations from short-term monitoring data

Box 3.2: Estimation of annual mean concentrations from short-term monitoring data

Example
 It has only been possible to carry out a monitoring survey (automatic or diffusion tube) at site S for six months between July and December 2008. The measured mean concentration M for this period is $30.2\mu\text{gm}^{-3}$. How can this be used to estimate the annual mean for this location?

Adjustment to estimate annual mean
 The adjustment is based on the fact that patterns in pollutant concentrations usually affect a wide region. Thus if a six month period is above average at one place it will almost certainly be above average at other locations in the region. The adjustment procedure is as follows:

1. Identify two to four nearby, long-term, continuous monitoring sites, ideally those forming part of the national network. These should be background sites to avoid any very local effects that may occur at roadside sites, and should, wherever possible lie within a radius of about 50 miles.

Obtain the annual means(A_m), for the calendar year for these sites, 2008 in this example. Work out the period means(P_m), for the period of interest, in this case July to December 2008. [It may be necessary to use unratified automatic data.]

Calculate the ratio, R, of the annual mean to the period mean $\left(\frac{A_m}{P_m}\right)$ for each of the sites.

Calculate the average of these ratios, R_a. This is then the adjustment factor.
 Multiply the measured period mean concentration M by this adjustment factor R_a to give the estimate of the annual mean for 2008.

Long term site	Annual mean 2008 (A _m)	Period Mean 2008 (P _m)	Ratio $\left(\frac{A_m}{P_m}\right)$
A	28.6	29.7	0.963
B	22.0	22.8	0.965
C	26.9	28.9	0.931
D	23.7	25.9	0.915
Average (R_a)			0.944

For this example the best estimate of the annual mean for site S in 2008 will be $M \times R_a = 30.2 \times 0.944 = 28.5\mu\text{gm}^{-3}$.

Notes
 Monitoring data for the long-term sites must have adequate data capture rates: above 90% is preferable; sites with data capture below 75% should not be used.
 It may be appropriate to use diffusion tube results from a long-term survey to adjust short-term diffusion tube results. To allow for the greater uncertainty of diffusion tubes results from four or more sites should be used. Ensure that the tubes are from the same supplier using the same method of preparation.
 If the short-term period covers, for instance, February to June 2009, and the work is being carried out in August 2009, then an annual mean for 2009 will not be available. The calculation can then be carried out using the ratio to the 2008 annual mean, but the result is then an estimate of the 2008 annual mean at the short-term site.

Modified from Box 3.2 page 3-4 of the technical Guidance 2009 [38].

2.4 Volatile Correction Model

Tapered Element Oscillating Microbalance (TEOM) analysers are widely used however, the outcome of the equivalence study means that TEOM analysers cannot strictly be used to measure PM₁₀ concentrations for comparison with the air quality objectives. Wherever possible the data collected should be adjusted using the Volatile Correction Model (VCM)

(as described in Table 5) rather than the use of a simple 1.3 multiplication factor.

Table 5. Application of the Volatile Correction Model

Box 3.4: Application of the Volatile Correction Model
<p>A VCM web portal is available through the national air quality archive at http://www.volatile-correction-model.info/Default.aspx This allows local authorities to download geographically specific correction factors to apply to the TEOM PM₁₀ results.</p> <p>There are a number of steps that need to be taken to apply the VCM, as the default settings for the TEOMs used in the UK contain a “US EPA correction factor” and are reported at standard temperature and pressure (STP).</p> <p>Step 1: Remove the default “US EPA correction factor” from the measured TEOM PM₁₀ data. TEOM instruments, as supplied by the manufacturer, include a default USEPA adjustment that is embedded into the software. This adjustment factor is:</p> $\text{Reported TEOM PM}_{10} (\mu\text{g. m}^{-3}) = (\text{TEOM PM}_{10} \text{ at STP } (\mu\text{g. m}^{-3}) \times 1.03) + 3 \mu\text{g. m}^{-3}$ <p>The TEOM PM₁₀ concentration at STP, with the US EPA adjustment factor removed, is given by:</p> $\text{TEOM}_{\text{STP}}\text{PM}_{10} = \frac{\text{TEOMPM}_{10} - 3}{1.03}$ <p>Step 2: Correct the measurements to atmospheric temperature and pressure The TEOM is configured to report measurements at a standard temperature (25°C) and a standard pressure (1 atm). This differs from the European position, which reports at ambient conditions and this difference therefore increases uncertainty in the comparison with the European reference method. By using measurements of ambient temperature and pressure, the temperature and pressure correction can be removed from the TEOM measurements at STP to provide an ambient temperature and pressure TEOM measurement (TEOM_{ATP}) using the following equation:</p> $\text{TEOM}_{\text{STP}}\text{PM}_{10} = \frac{\text{TEOMPM}_{10} - 3}{1.03} \times \frac{1}{P} \times \frac{T + 273}{273}$ <p>Where P = ambient pressure in atmospheres and T = ambient temperature in °C</p> <p>Step 3: The Regional Purge Concentration The regional purge concentration is the mean of up to three of the nearest Automatic Urban and Rural Network (AURN) FDMS instruments within the model domain. Current evidence suggests that the model domain extends to approximately 130 km from the measurement site. This is multiplied by 1.87 to account for the additional loss of volatile material from the TEOM filter, which is maintained at 50°C, compared to the FDMS filter, which is maintained at 30°C. This factor has been derived from TEOM and FDMS co-location studies.</p> <p>Step 4: The calculating the TEOM_{VCM} concentration Steps 1 and 3 can be combined into the equation below.</p> $\text{TEOM}_{\text{STP}}\text{PM}_{10} = \left(\frac{\text{TEOMPM}_{10} - 3}{1.03} \times \frac{1}{P} \times \frac{T + 273}{273} \right) - (1.87 \times \text{Regional Purge Concentration})$ <p>These calculations will be undertaken by the VCM web portal to provide a time series of daily or hourly correction factors that can then be applied to TEOM PM₁₀ measurements as they are recorded by the instrument.</p>

Modified from Box 3.4 page 3-11 of the technical Guidance 2009 [38].

3 New Monitoring Data

3.1 Summary of Monitoring Undertaken

3.1.1 Automatic Monitoring Sites

3.1.1.1 Council Run Sites

Currently North West Leicestershire District Council operates 2 automatic monitors in the district located at Castle Donington, Coalville. These monitors are all located with AQMAs declared for exceedences of the nitrogen dioxide air quality standards.

Details of the sites are shown in Table 7. Full Data is available from North West Leicestershire District Council Website [50]

Both monitors are API 200A NO_x analysers

3.1.1.2 Site operated by third parties

Aggregate industries operate 1 partisol PM₁₀ monitor located on Bradgate Drive in Coalville for environmental monitoring relating to their environmental permit.

East Midlands Airport operate an automatic monitor for NO₂ as part of their environmental monitoring program.

Details of the sites are shown in Table 7.

3.1.2 Non-Automatic Monitoring Sites

3.1.2.1 Council Run Sites

The council undertakes extensive diffusion tube monitoring within its AQMAs. Details of the tubes are shown in Table 8. Full Data is available from North West Leicestershire District Council Website [49]

3.1.2.2 East Midlands Airport run sites

The East Midlands Airport undertakes extensive diffusion tube monitoring in the area of the airport. Details of the tubes are shown in Table 9..

3.2.1.2 Diffusion Tube Monitoring Data

An overview of the data is shown in Table 12. Façade corrections of relevant tubes is shown in Table 14. Full monitoring data is available in Appendix B.

3.2.1.2.1 Coalville

Tubes 06N 35N 36N 42N 43N are located within the Coalville AQMA. 53N is located north of the AQMA.

- Tubes 06N, 35N and 36N did not exceed the annual mean objective but exceeded $36\mu\text{gm}^{-3}$
- Tubes 42N, 43N and 53N did not exceed the annual mean objective

3.2.1.2.2 Castle Donington

Tubes 16N, 17N 18N, 19N, 37N, and 38N are located within the Castle Donington AQMA. Tubes 12N, 14N, 16N, 40N and 41N are located south of the AQMA. 54N is located west of the AQMA

- Tubes 16N, 17N, 37N and 54N did not exceed the annual mean objective but did exceed $36\mu\text{gm}^{-3}$
- Tube 18N and 41N exceeded the annual mean objective
- Tubes 12N, 14N, 19N, 38N, and 40N did not exceed the annual mean objective

3.2.1.2.3 Copt Oak

Tube 45N is located within the AQMA. Tubes 08N and 32N are located on the façade of the nearest receptor to the M1 and level with the 'kerb' of the M1 respectively

- Tube 32N exceeded the annual mean objective.
- Tubes 08N, and 45N were significantly below the annual mean objective.

3.2.1.2.4 Kegworth

Tubes 20N, 22N, 46N, 47N, 48N, 51N and 52N are within the Kegworth AQMA. Tube 23N is a Suburban tube placed under East Midlands Airport flight path.

- Tubes 46N and 48N exceeded the annual mean objective. Façade corrected annual mean of 48N was just below the annual mean objective.
- Tube 47N did not exceed the annual mean objective but did exceed $36 \mu\text{g m}^{-3}$
- Tubes 51N and 52N were below the annual mean objective but exceeded $36 \mu\text{g m}^{-3}$. Both the façade corrected annual mean and the façade corrected annualised mean were both significantly below the annual mean objective
- Tubes 20N, 22N, 23N were significantly below the annual mean objective

3.2.1.2.5 M1 (Mole Hill Farm and Long Whatton)

Tube 26N is located on the façade of Molehill house within the M1 AQMA.

Tube 39N is located east of the M1 between the M1 and the nearest receptor.

Both tubes were significantly below the annual mean objective

3.2.1.2.6 Other Tubes

Tube 31N is located in Sinope. It was significantly below the annual mean objective.

Tube 49N and 50N are located in Hugglescote, north of the Central Road | Station Road | Grange Road crossroads, and on the crossroads respectively.

Both tubes were significantly below the annual mean objective.

Figure 11. Trends in Annual Mean Nitrogen Dioxide Concentrations measured at Diffusion Tube Monitoring Sites

3.2.2 Particulate Matter (PM₁₀)

3.2.2.1 Bradgate Drive

The annual mean objective was not exceeded

The site recorded 12 exceedences of the daily mean objective this is well below the 35 permitted exceedences.

3.2.2.2 East Midlands Airport

The annual mean was not exceeded

The site recorded 5 exceedences of the daily mean objective this is well below the 35 permitted exceedences.

Table 15. Results of Automatic Monitoring for PM₁₀: Comparison with Annual Mean Objective

Site ID		4 Bradgate Drive Coalville	5 EMA
Site Type		Suburban	Other
Within AQMA?		N	N
Valid Data Capture for Monitoring Period % ^a		93.97	74.79
Valid Data Capture 2014 % ^b		93.97	74.79
Confirm Gravimetric Equivalent (Y or N/A)		Y	N/A
Annual Mean Concentration (µg/m ³)	2011* ^c	21.73	19.26
	2012* ^c	19.93	17.63
	2013* ^c	21.67	18.36
	2014 ^c	22.23	17.12

In bold, exceedence of the PM₁₀ annual mean AQS objective of 40µg.m⁻³

^a i.e. data capture for the monitoring period, in cases where monitoring was only carried out for part of the year

^b i.e. data capture for the full calendar year (e.g. if monitoring was carried out for six months the maximum data capture for the full calendar year would be 50%)

^c Means should be "annualised" as in Box 3.2 of TG(09) (<http://laqm.defra.gov.uk/technical-guidance/index.html?d=page=38>), if valid data capture is less than 75%

* Annual mean concentrations for previous years are optional

	TEOM corrected as Box 3.4 Application of Volatile Correction Model of LAQM.TG(09)
--	---

Table 16. Results of Automatic Monitoring for PM₁₀: Comparison with 24-hour Mean Objective

Site ID		4 Bradgate Drive Coalville	5 EMA
Site Type		Suburban	Other
Within AQMA?		N	N
Valid Data Capture for Monitoring Period % ^a		93.97	74.79
Valid Data Capture 2013 % ^b		93.97	74.79
Confirm Gravimetric Equivalent (Y or N/A)		Y	N/A
Number of Daily Means > 50µg/m ³	2011* ^c	11	4
	2012* ^c	9	2
	2013* ^c	14	6
	2014	12	5

In bold, exceedence of the PM₁₀ daily mean AQS objective (50µg.m⁻³ – not to be exceeded more than 35 times per year)

^a i.e. data capture for the monitoring period, in cases where monitoring was only carried out for part of the year

^b i.e. data capture for the full calendar year (e.g. if monitoring was carried out for six months the maximum data capture for the full calendar year would be 50%)

^c if data capture for full calendar year is less than 90%, include the 90.4th percentile of 24-hour means in brackets

* Number of exceedences for previous years is optional

	TEOM corrected as Box 3.4 Application of Volatile Correction Model of LAQM.TG(09)

Figure 12. Trends in Annual Mean Particulate Matter (PM₁₀) at Bradgate Drive

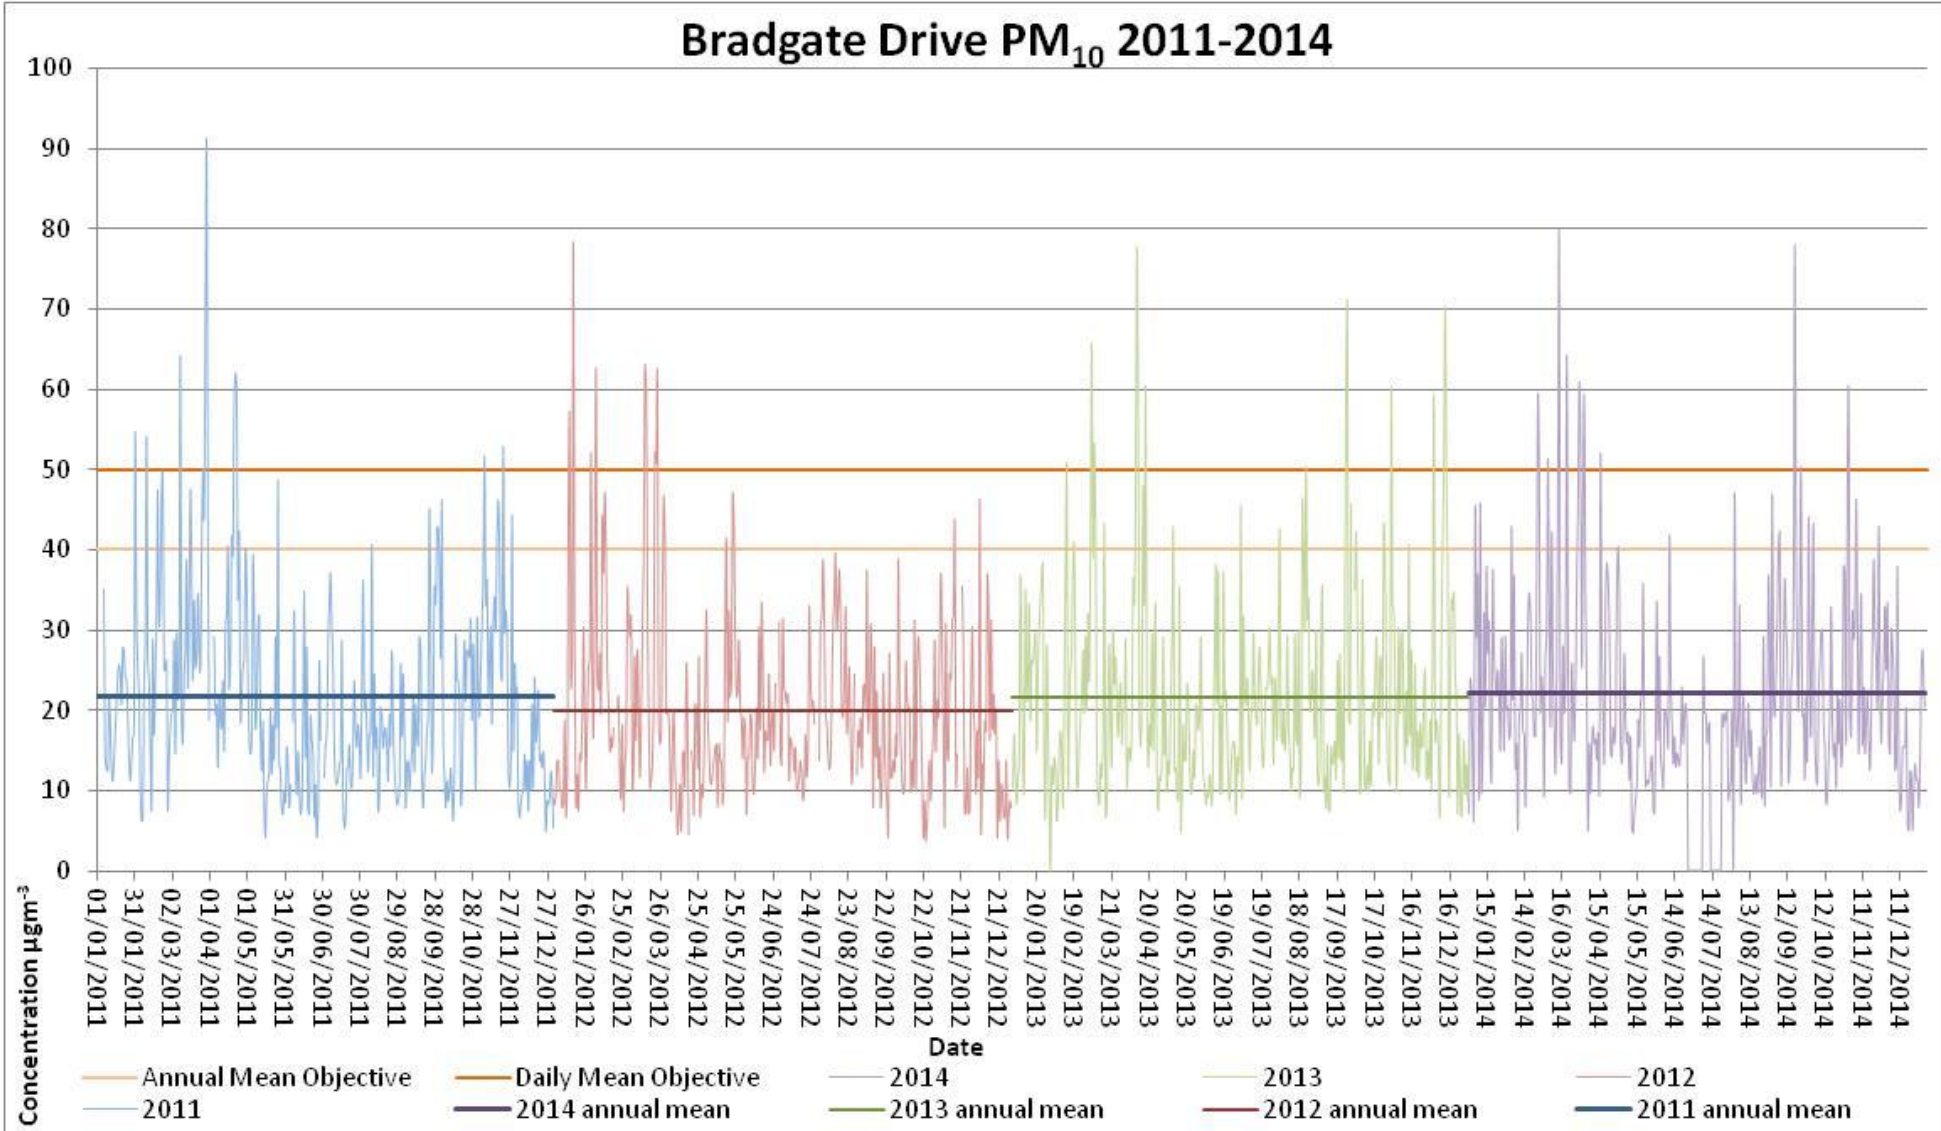

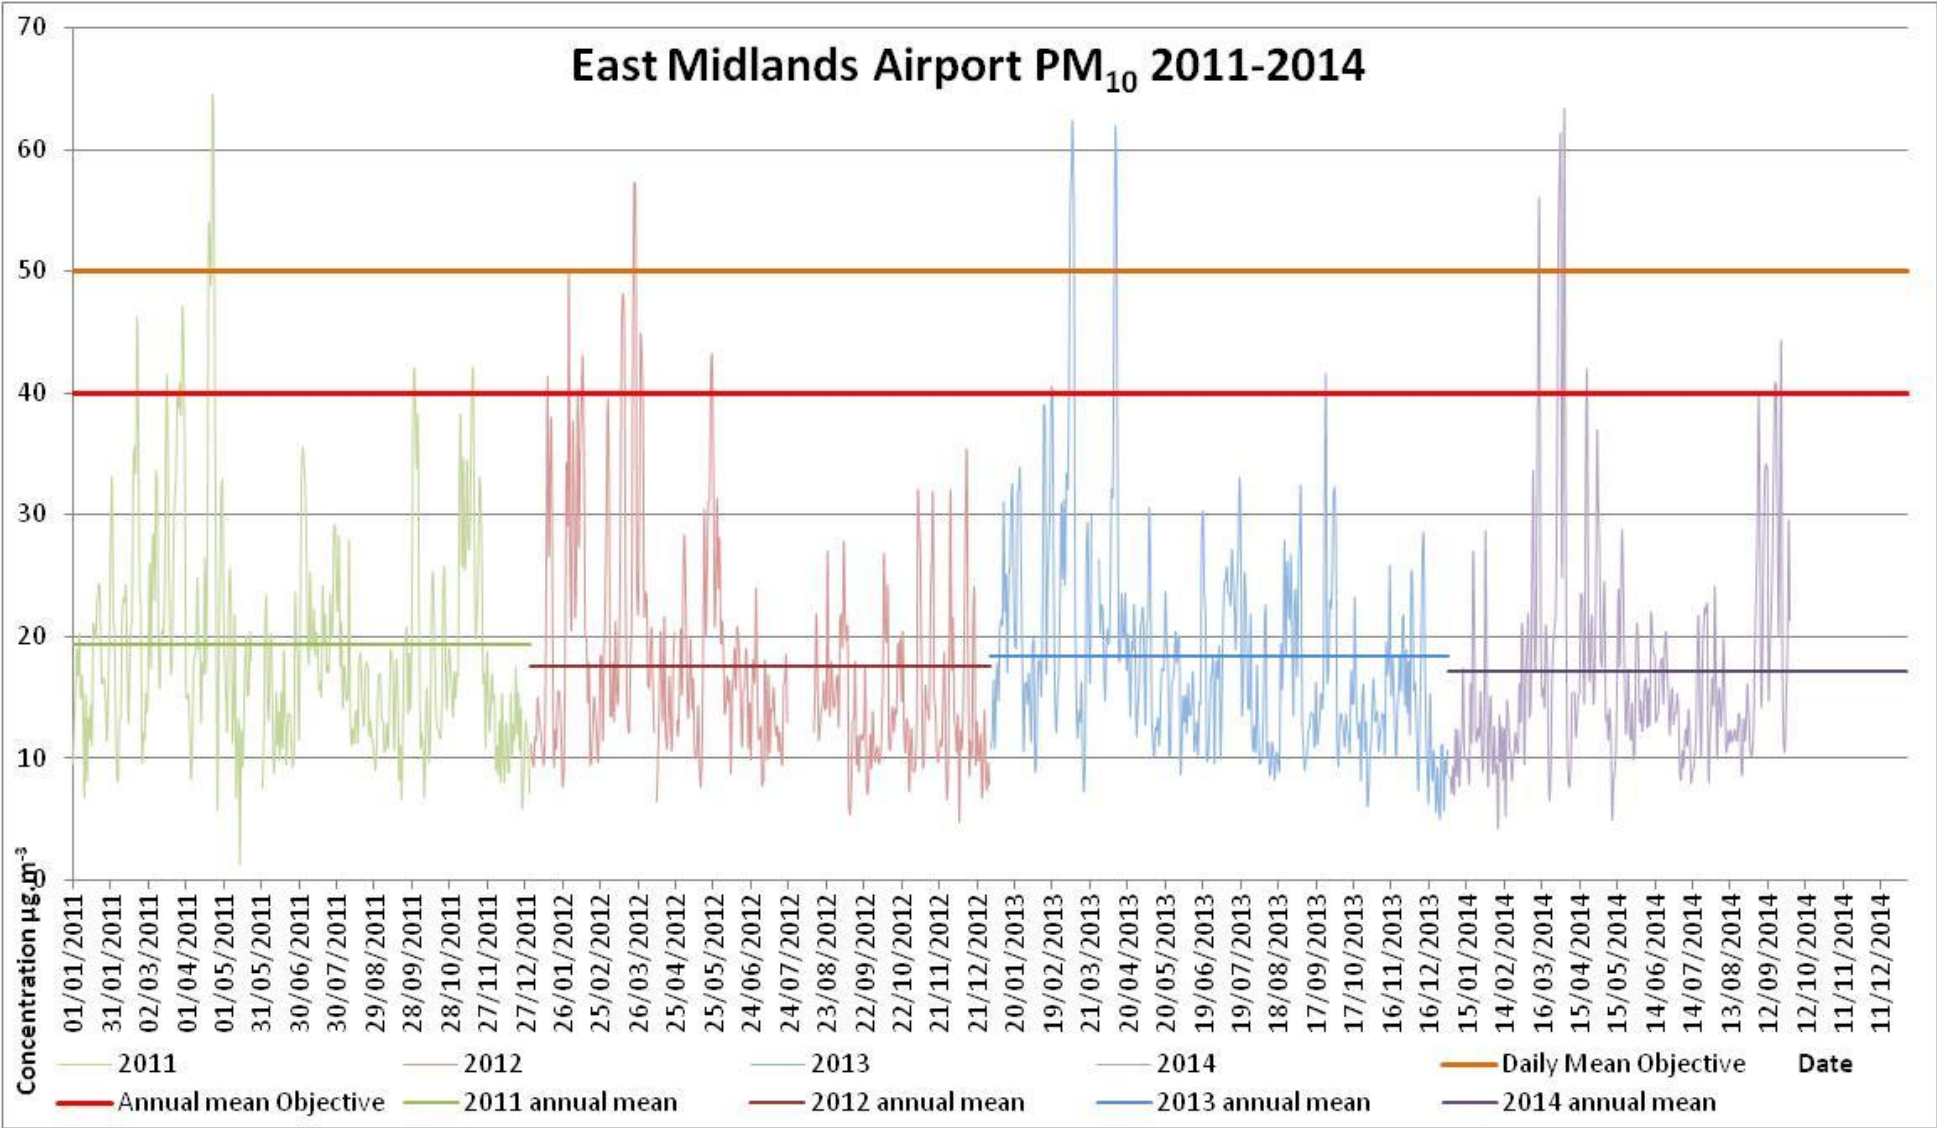

Figure 13. Trends in Annual Mean Particulate Matter (PM₁₀) at East Midlands Airport

3.2.3 Sulphur Dioxide

This authority does not currently monitor this pollutant

3.2.4 Benzene

This authority does not currently monitor this pollutant

3.2.5 Other pollutants monitored

This authority does not currently monitor any other pollutants

3.2.6 Summary of Compliance with AQS Objectives

North West Leicestershire District Council has examined the results from monitoring in the district. Concentrations outside of the AQMA are all below the objectives at relevant locations, therefore there is no need to proceed to a Detailed Assessment.

4 Road Traffic Sources

4.1 Narrow Congested Streets with Residential Properties Close to the Kerb

North West Leicestershire District Council confirms that there are no new/newly identified congested streets with a flow above 5,000 vehicles per day and residential properties close to the kerb, that have not been adequately considered in previous rounds of Review and Assessment.

4.2 Busy Streets Where People May Spend 1-hour or More Close to Traffic

North West Leicestershire District Council confirms that there are no new/newly identified busy streets where people may spend 1 hour or more close to traffic.

4.3 Roads with a High Flow of Buses and/or HGVs.

North West Leicestershire District Council confirms that there are no

new/newly identified roads with high flows of buses/HDVs.

4.4 Junctions

North West Leicestershire District Council confirms that there are no new/newly identified busy junctions/busy roads.

4.5 New Roads Constructed or Proposed Since the Last Round of Review and Assessment

North West Leicestershire District Council has assessed new/proposed roads meeting the criteria in Section A.5 of Box 5.3 in TG(09), and concluded that it will not be necessary to proceed to a Detailed Assessment.

4.6 Roads with Significantly Changed Traffic Flows

North West Leicestershire District Council confirms that there are no new/newly identified roads with significantly changed traffic flows.

4.7 Bus and Coach Stations

North West Leicestershire District Council confirms that there are no relevant bus stations in the Local Authority area.

5 Other Transport Sources

5.1 Airports

East midlands airport handled 4.6 million passengers and 308,935 tonnes of cargo in 2014

$$\begin{aligned} \frac{308935}{100000} &\cong 3.09\text{mppa} \\ 3.09 + 4.6 &= 7.69 \text{ mppa} \\ 7.69 &< 10\text{mppa} \end{aligned}$$

North West Leicestershire District Council confirms that there are no

airports in the Local Authority area requiring a detailed assessment.

5.2 Railways (Diesel and Steam Trains)

5.2.1 Stationary Trains

North West Leicestershire District Council confirms that there are no locations where diesel or steam trains are regularly stationary for periods of 15 minutes or more, with potential for relevant exposure within 15m.

5.2.2 Moving Trains

North West Leicestershire District Council confirms that there are no locations with a large number of movements of diesel locomotives, and potential long-term relevant exposure within 30m.

5.3 Ports (Shipping)

North West Leicestershire District Council confirms that there are no ports or shipping that meet the specified criteria within the Local Authority area.

6 Industrial Sources

6.1 Industrial Installations

6.1.1 New or Proposed Installations for which an Air Quality Assessment has been Carried Out

North West Leicestershire District Council confirms that there are no new or proposed industrial installations for which planning approval has been granted within its area or nearby in a neighbouring authority.

6.1.2 Existing Installations where Emissions have Increased Substantially or New Relevant Exposure has been Introduced

North West Leicestershire District Council confirms that there are no industrial installations with substantially increased emissions or new

relevant exposure in their vicinity within its area or nearby in a neighbouring authority.

6.1.3 New or Significantly Changed Installations with No Previous Air Quality Assessment

North West Leicestershire District Council confirms that there are no new or proposed industrial installations for which planning approval has been granted within its area or nearby in a neighbouring authority.

6.1.4 Major Fuel (Petrol) Storage Depots

There are no major fuel (petrol) storage depots within the Local Authority area.

6.2 Petrol Stations

North West Leicestershire District Council confirms that there are no petrol stations meeting the specified criteria.

6.3 Poultry Farms

North West Leicestershire District Council confirms that there are no poultry farms meeting the specified criteria.

7 Commercial and Domestic Sources

7.1 Biomass Combustion – Individual Installations

North West Leicestershire District Council confirms that there are no biomass combustion plant in the Local Authority area.

7.2 Biomass Combustion – Combined Impacts

North West Leicestershire District Council confirms that there are no biomass combustion plant in the Local Authority area.

7.3 Domestic Solid-Fuel Burning

North West Leicestershire District Council confirms that there are no areas of significant domestic fuel use in the Local Authority area.

8 Fugitive or Uncontrolled Sources

North West Leicestershire District Council confirms that there are no potential sources of fugitive particulate matter emissions in the Local Authority area.

9 Implementation of Action Plans

The council has recently adopted a new action plan framework document and is currently working with Leicestershire County Council to draw up schemes for assessment inline with the framework.

10 Conclusions and Proposed Actions

10.1 Conclusions from New Monitoring Data

No exceedences where recorded outside of existing AQMAs

10.2 Conclusions from Assessment of Sources

There are no sources requiring detailed assessment

10.3 Proposed Actions

- Progress action plan
- Submit 2016 Progress report.

12 Appendices

Appendix A. Appendix A: QA/QC Data

QA/QC of automatic monitoring

The analyser at Coalville is an API 200 chemiluminescence analyser,

Routine instrument calibrations are conducted once per month, which involve zero and span checks, a written record of the gas analyser diagnostics and a general visual inspection of all equipment is undertaken.

Data retrieval and daily data checking

Data from the monitoring station is retrieved and processed on a data logger as 15-minute mean data. The logger is interrogated via a Siemens TC35i GSM modem at 8-hourly intervals by the ENVIEW 2000 software hosted at TRL. This is used to retrieve, check and archive data.

TRLs internal QA/QC procedures require all data to be backed up on a secure server and all documentation associated with each site to be uniquely identified and securely stored to provide an audit trail.

Daily data inspections are undertaken during office hours using the facilities of the Data Management System. Initial observations of the Management System indicate whether the site has been contacted during its nominated 'poll time' overnight. If this has not been successful a manual poll of the site may be required. If this is not successful further investigation of the communications integrity will be required to establish contact with the site modem and data logger.

Three day plots of recorded data are viewed for the requested site, and these are inspected and assessed for continuity, validity, minimum and maximum values, date and time, power failures and general integrity. All anomalies are recorded on the Daily Check sheet, as required. Any anomalies or queries arising from daily inspection of data, or system operation, are brought to the attention of the Project Manager who will evaluate the situation, and initialise any necessary action. In the event that the PM is not available, contact will be made with the next available senior person within the monitoring team. Any

issues identified with equipment operation will be referred to the client for attention within 24 hours (excluding weekends).

On a weekly basis, data are examined using summary statistics and outlier analysis to establish data validity. In the event that unusual data episodes are recorded, these would be routinely examined over longer data periods to establish their impact on trends, but would also be cross referenced with data peaks and troughs recorded at other national monitoring stations. In addition, integrity and validity of data logger clock times are checked, and any significant errors recorded in the Data Management System logbook.

All site data recorded through the Data Management System is archived on TRLs Network. The data is backed up daily, and the TRL IT Department maintains these data within their long-term and secure archives. This secures all data in the event of any system failure.

Data calibration and ratification

Data is ratified as per AURN recommended procedures. The calibration and ratification process for automatic gas analysers corrects the raw dataset for any drift in the zero baseline and the upper range of the instrument. This is done using a Microsoft Excel-based calibration and ratification file which incorporates the zero and span check information from the calibration visits. The zero reading recorded during the calibration visits is used to adjust any offset of the baseline of the data. The difference between the span value obtained between one calibration visit and the next visit is used to calculate a factor. This change is assumed to occur at the same rate over the period between calibrations and as such the factor is used as a linear data scaler. This effectively results in the start of the period having no factor applied and the end of the period being scaled with the full factor with a sliding scale of the factor in-between. After applying the calibration factors, it is essential to screen the data, by visual examination, to see if they contain any unusual measurements or outliers. Errors in the data may occur as a result of equipment failure, human error, power failures, interference or other disturbances. Data validation and ratification is an important step in the monitoring process. Ratification involves

North West Leicestershire District Council

considerable knowledge of pollutant behaviour and dispersion, instrumentation characteristics, field experience and judgement.

On completion of this data correction procedure, these data were converted to hourly means and a summary of these data were provided to North West Leicestershire District Council.

Appendix B. Monthly Diffusion Tube, façade correction, and annualisation Data

Full details and results of Diffusion Tube monitoring in North West Leicestershire is available from the councils website
